

HTA Firmware Tracker — How to Open

Every time you want to check it

- 1 Open **Finder** and go to the `hta-firmware-tracker` project folder.
- 2 Double-click `start.command` (not `start.sh` — macOS doesn't offer Terminal in "Open With" for `.sh` files, but `.command` files open straight into Terminal). First time only: macOS will likely block it with a "cannot be opened" security warning — **right-click** `start.command` → **Open**, then click **Open** again in the dialog that appears. After that one-time step, double-clicking works normally.
- 3 A Terminal window opens and starts the app. Your browser should open automatically to the dashboard. If it doesn't, go to: **`http://127.0.0.1:8811`**

When you're done

Go back to that Terminal window and press **Control + C** to stop the app. Closing the Terminal window also stops it.

Running it from Terminal directly (alternative)

If you'd rather type it than double-click:

```
cd "hta-firmware-tracker"  
./start.sh
```

(`start.sh` and `start.command` are identical — `start.command` just exists because Finder can double-click it.)

Good to know

- The app only runs **while that Terminal window is open** on your Mac. If you close it, the dashboard stops working (for you and for anyone else you've shared the address with).
- Right now it's only reachable from **your own computer** — coworkers can't see it yet. Getting it onto a machine that's always on (and reachable on the network) is the first item on the [to-do list](#); once that's done, nobody needs to "start" anything — it's just always there at a fixed address.
- If the page looks stale, click "**Check All Now**" in the top-left of the dashboard to force a fresh check of everything.
